

Replacing Better Air gravity dampers

1. Remove old dampers and stainless steel rods.

2. Insert new stainless steel rods into dampers.

3. Insert one end of stainless steel rod with damper attached, into one of the two damper holes on the chimney fan housing

4. By pushing down on the damper and rod assembly line it up with the damper hole on the other side of the chimney fan housing and push until it snaps into place, taking care as not to bend the stainless steel rod, as doing this will affect the damper movement

5. Repeat with other damper and stainless steel rod
